EASY

1. FrogJmp

Count minimal number of jumps from position X to Y.

score: 100 of 100

Task description

A small frog wants to get to the other side of the road. The frog is currently located at position X and wants to get to a position greater than or equal to Y. The small frog always jumps a fixed distance, D.

Count the minimal number of jumps that the small frog must perform to reach its target.

Write a function:

```
class Solution { public int solution(int X, int Y,
int D); }
```

that, given three integers X, Y and D, returns the minimal number of jumps from position X to a position equal to or greater than Y.

For example, given:

```
X = 10
Y = 85
D = 30
```

the function should return 3, because the frog will be positioned as follows:

- after the first jump, at position 10 + 30 = 40
- after the second jump, at position 10 + 30 + 30 = 70
- after the third jump, at position 10 + 30 + 30 + 30 = 100

Assume that:

- X, Y and D are integers within the range [1..1,000,000,000];
- X ≤ Y.

Complexity:

- expected worst-case time complexity is O(1);

Solution

Programming language used: Java

Total time used: 3 minutes

Effective time used: 3 minutes

Notes: *not defined yet*

Task timeline

19:25:52 — 19:28:38

Code: 19:28:38 UTC, java, final, score: **100**

show code in pop-up

```
1  // you can also use imports, for example:
2  // import java.util.*;
3
4  // you can write to stdout for debugging purposes, e.g.
5  // System.out.println("this is a debug message");
6
7  class Solution {
8    public int solution(int X, int Y, int D) {
9      if (Y<=X) return 0;
10
11     if (D < 1) return 0;
12
13     int r = (Y-X)/D;
14
15     if ((Y-X) > (D*r)) {
```

- expected worst-case space complexity is O(1).

```
16          r++;
17        }
18
19        return r;
20      }
21    }
```

Analysis summary

The solution obtained perfect score.

Analysis

Detected time complexity:
O(1)
